

Sustainable Backyard

CARE FOR OUR EARTH, CULTIVATE OUR FUTURE

Start with your green bin

All food scraps and yard trimmings go in your curbside green bin. This includes leftovers from your barbecues as well as the kitchen. Your local composting facility turns them into compost for farms and gardens and clean energy.

Set up CRV bins for gatherings

Backyard events usually involve drinks along with food. A temporary bin for beverage containers (next to compost and landfill bins) ensures you get your cash back instead of throwing it away.

Create compost in your backyard

As an alternative to curbside composting, put yard and food scraps in your backyard compost pile or a local community composting site. This creates nutrient-rich compost to feed local gardens.

Grow what you eat

Plant vegetables, fruits, and herbs for your family. Homegrown produce eliminates packaging waste and keeps food fresh, from garden to table.
